TECHNICAL INFORMATION ON THE DATA FILES

The 10 percent subsample of the .05 sample of the 1990 population census of Indonesia data is stored in two kind of files, i.e. raw data file (INDO90.DAT) and two SPSS system files (INDO90PER.SYS and INDO90HSE.SYS). All three files are stored on subdirectory : csde\dsk2\seafert\indo\DATA\CENSUS90 which is available on CSDE UNIX SYSTEM : csde.washington.edu. To access the data files, use the following information :

1. Enter into CSDE UNIX SYSTEM by typing : telnet csde.washington.edu
2. Type your password (can be obtained by asking the permission from CSDE computer system Supervisor)
3. Go to subdirectory : csde\home1\seafert\indo\DATA\CENSUS90

However, the raw data are also available on the single tape format.

The configuration of the file is :

LRECL = .....

BLKSIZE = .....

LABEL = .....

RECFM = .....

UNIT = .....

## DESCRIPTION OF DATA FILE

### Introduction

The 1990 Indonesian Population Census is the fourth census conducted by the government of the Republic of Indonesia. The census enumeration took place within the period September 15 through October 31, 1990. It covered all population residing in the entire geographic area of Indonesia regardless of their residence status. Permanent residence, non-permanent residence such as the homeless, the crew of ships carrying Indonesian flag, boat/floating house people, remotely located tribesmen, as well as foreign citizen (except members of diplomatic corps) were enumerated.

The definition of population in the 1990 Census is all residents of the entire geographic territory of Republic of Indonesia who have stayed for six months or longer and those who intended to stay even though their length of stay was less than six months. Based on this definition, therefore the enumeration activity applied both "de jure" and "de facto" approach. "De jure" approach means people are recorded where they formally lived, whereas "de facto" means people are recorded where they are found. Permanent residents were approached using de jure criterion and people with no permanent residence were approached using "de facto" criterion. For example, for people who have permanent residence but have been away from home for 6 months or more were no longer be regarded as the member of their household, therefore they were recorded in their new place. On the otherhand, those who have lived in a particular dwelling unit for less than six months were recorded where they lived if they intended to stay.

The Census enumeration was carried out in two stages, i.e. complete enumeration and sample enumeration. A complete enumeration was intended to compiled population figures at various levels such as administrative and sex level. This was conducted using complete (Form SP90.L11, see Appendix A.1) questionnaire. Meanwhile, sample enumeration (5 percent of total households) was undertaken using sample (form SP90-S, Appendix A.2) questionnaire to collect the various individual (population) characteristics such as citizenship, religion, education, language, employment, births, deaths, and movement.

### Sample Design of the .05 sample and 0.005 subsample

The design of sample selection for 1990 Census followed the following general rule. First, regencies/municipalities were considered an estimation area. Then, based on this condition two sampling strata were formed at this level, one for urban area and one for rural area. Urban stratum will be used to select sample from urban population/households, meanwhile rural stratum will be used for rural population/households. In addition, to perform the sample selection, all of the district and village in each stratum should be listed in certain order based on their geographical location.

In the otherhand, Census Block (CB) with the size of 100 households was used as sampling unit. This unit was created as a solution of the problem of too large unit size and too small unit size. The problem of too large size occurs when Enumeration Area (with 200-300 households) would be used as sampling unit. If EA was used as sampling unit, therefore the variation in area and population size would not be practical. On the contrary, the size of single household would be too costly to be used as sampling unit.

There are two types of CBs, one is ordinary CB and the other is special CB. Ordinary CB consist of ordinary household with the maximum size 100 households or special household (such as dormitory, military compound,etc) with numbered less than 50 persons. For special household with number between 50-100, they were treated as special CB which has different treatment.

Therefore, applying the unit sampling (CBs) into each stratum has resulted four different sampling schemes based on the size of the sample required :

1. Rural sampling scheme for ordinary CBs in regencies or municipalities.
2. Urban sampling scheme for ordinary CBs in regencies.
3. Urban sampling scheme for ordinary CBs in municipalities.
4. Sampling scheme for special CBs.

For the first scheme, districts were ordered according to their geographical location starting from southwest corner. Within each District, villages were ordered according to their location. Therefore, certain percent of CBs were selected systematically (not necessary 5 percent, depend on the size of the regency or municipality). The similar steps also apply for the second scheme.

However, The third scheme has different order. In this frame, The CBs in urban villages were ordered in in circular fashion starting from the centre of the city. Using systematic sampling with a random start, a certain percent of the Cbs were selected.

Special Cbs were included in the sample as separate category. From each block, a certain percent of the household were selected. This method based on assumption that special Cbs were not numerous and the residents have the homogenous characteristics.

The enumerations using the form sample (Form SP90-S) were undertaken for each household in the selected Cbs. It should also be stressed again that the percentage number of households selected for each regency or municipality was varied. It was not necessary 5 percent as in 1980 Census. It was depending on the size of the regency or

municipality. The bigger the size the regency, the bigger the percentage sample selected from that particular regency. This is the main difference of the sampling design for 5 percent sample between Census 1990 and Census 1980.

Finally, the sampling design for 0.005 subsample of the Census 1990 was merely based on 5 percent sample. The sampling selection was conducted by taking 10 percent subsample from the sample systematically. The fixed 10 percent subsample was applied for each municipality/regency.

### Structure and Contents

The data file consists of 2 record types, a Household Record, and a Person Record. Person records are nested within household records.

1. Household Record, Record Type 1, contains 46 variables (187 characters). The first three variables are location variables, identifying the Province, Kabupaten/Kotamadya (Regency/Municipality), and whether the area is urban or rural. Variables H4 through H37 describe household characteristics. Variable H38 is a household inflation factor (see below for an explanation of the inflation factor variable). There are also eight variables constructed from other variables; these occupy columns 176-187. Columns 134-175 of the household record are left blank.

2. Person Record, Record Type 2, contains information on every person in the household. The first three variables repeat information from record type 1 on location of the household in which the person resides. There are 107 variables which occupy 187 columns. Some variables were only collected for persons aged 10 and above (Variables P38 to P56), for example, those that pertain to work and employment. Questions on children ever born was asked only of ever-married and currently married women (P57 to P73). Variable P75 (column 134-138) on the person record is the inflation factor for persons. There are 32 constructed variables (P76 to P107). These occupy columns 139-187.

### Inflation Factor

The Indonesian Central Bureau of Statistics attached sample inflation factor to household and individual records. For the 0.005 subsample, there are different inflation factor for each province, urban and rural area within province and sex within area. Beside, the inflation factor for the head of the household are different from the inflation factor of members of the household, but the same with inflation factor of the household. For more information on the calculation of inflation factor, please see Appendix I.

H2	KABUPATEN/KOTAMADYA (Regency/Municipality)	3 - 4
----	---	-------

Kabupaten and Kotamadya are administrative units at the second or sub-provincial level. Each Kabupaten or Kotamadya within a province is identified by a 2-digit code. To locate a Kabupaten, therefore, it will be necessary to use the 2-digit province code also. For example, Aceh Selatan, a Kabupaten in Aceh province is identified by the code 1101 (the first 2 digits 11, refer to the code for Aceh province, and the next two numbers 01, to the Kabupaten code). See Appendix C for a complete list of Kabupaten/Kotamadya codes .

Variable Number	Variable Description and Codes: Household Record	Column
H3	URBAN/RURAL	5
	Classification of a village as urban or rural depends on population density, percentage of households engaged in agriculture and availability of urban facilities, such as school, hospital, road, and electricity. A scoring system was used to add up a village's score on these three dimensions; a combined score of 20 or more placed it as urban while a score below 20 put it in the rural category (see Appendix B for details).	
	1       Urban 2       Rural	
H4	SAMPLE CODE NUMBER	6 - 8
H5	SAMPLE SERIAL NUMBER	9 - 11
	This is a 3-digit number, identifying each household within the Census block.	
H6	HOUSEHOLD TYPE	12
	1       Private Household 2       Institutional Household	
H7	NUMBER OF HOUSEHOLD MEMBERS	13 - 14
	Those who usually live in a particular household regardless their location at the time of enumeration are classified as household member. A person was no longer be regarded as a member of his or her former household if the the person had been absent from home for six months or longer, or had left home for the purpose of moving away even when the six months limit had not been reached. On the otherhadn, a guest who had stayed for six months or more, or even for less then six months but intended to move in was recorded as a household member.	

Variable Number	Variable Description and Codes: Household Record	Column
H8	NUMBER OF INSTITUTIONAL HOUSEHOLD MEMBERS  The actual number of persons in the institutional household is recorded.	15 - 18
H9	NUMBER OF PRIVATE HOUSEHOLDS IN THE ENUMERATION AREA  An ordinary or private household is an individual or a group of people living in a physical/census building unit or part thereof who make common provision for food and other essentials of living.	19 - 21
H10	NUMBER OF INSTITUTIONAL HOUSEHOLDS IN THE ENUMERATION AREA  The actual number of institutional household is chosen in the enumeration area	22 - 23
(COLUMNS 24-26 ARE LEFT BLANK)		
H11	RECORD TYPE  For the household record, the record type number is 1.	27
H12	TYPE OF BUILDING  1 Independent Building with Single dwelling unit 2 Independent Building with two dwelling units 3 Independent Building with more than two dwelling units 9 No answer	28

P2	KABUPATEN/KOTAMADYA (Regency/Municipality)	3 - 4
----	---	-------

Kabupaten and Kotamadya are administrative units at the second or sub-provincial level. Each Kabupaten or Kotamadya within a province is identified by a 2-digit code. To locate a Kabupaten, therefore, it will be necessary to use the 2-digit province code also. For example, Aceh Selatan, a Kabupaten in Aceh province is identified by the code 1101 (the first 2 digits 11, refer to the code for Aceh province, and the next two numbers 01, to the Kabupaten code). See Appendix C for a complete list of Kabupaten/Kotamadya codes .

Variable Number	Variable Description and Codes: Person Record	Column
P3	URBAN/RURAL	5
	Classification of a village as urban or rural depends on population density, percentage of households engaged in agriculture and availability of urban facilities, such as school, hospital, road, and electricity. A scoring system was used to add up a village's score on these three dimensions; a combined score of 20 or more placed it as urban while a score below 20 put it in the rural category (see Appendix B for details).	
	1      Urban 2      Rural	
P4	SAMPLE CODE NUMBER	6 - 8
P5	SAMPLE SERIAL NUMBER	9 - 11
	This is a 3-digit number, identifying each household within the Census block.	
P6	HOUSEHOLD TYPE	12
	1      Private Household 2      Institutional Household	
P7	NUMBER OF HOUSEHOLD MEMBERS	13 - 14
	Those who usually live in a particular household regardless their location at the time of enumeration are classified as household member. A person was no longer be regarded as a member of his or her former household if the person had been absent from home for six months or longer, or had left home for the purpose of moving away even when the six months limit had not been reached. On the other hand, a guest who had stayed for six months or more, or even for less than six months but intended to move in was recorded as a household member.	

Variable Number	Variable Description and Codes: Person Record	Column
--------------------	--	--------

---

P8	NUMBER OF INSTITUTIONAL HOUSEHOLD MEMBERS	15 - 18
----	---	---------

The actual number of persons in the institutional household is recorded.

P9	NUMBER OF PRIVATE HOUSEHOLDS IN THE ENUMERATION AREA	19 - 21
----	---	---------

An ordinary or private household is an individual or a group of people living in a physical/census building unit or part thereof who make common provision for food and other essentials of living.

P10	NUMBER OF INSTITUTIONAL HOUSEHOLDS IN THE ENUMERATION AREA	22 - 23
-----	---	---------

The actual number of institutional household is chosen in the enumeration area

(COLUMNS 24-26 ARE LEFT BLANK)

P11	RECORD TYPE	27
-----	-------------	----

For the person record, the record type number is 2.

**Appendix D: Field of Study (For Variable P30,  
Person Record)**

Codes are currently not available.

**Appendix E: Occupation Codes (3-digit)**

Codes are currently not available.

**Appendix F: Industry Codes (2-digit)**

Codes are currently not available.

## **Appendix G: Inflation Factor**

Example using the data of Province 11 (Aceh).

The number of households and population of province 11 are as follows :

	No.of Household	No. of Population	
		Male	Female
Urban	105,019	277,884	261,156
Rural	591,847	1,438,906	1,436,728

The execution of 1990 Population Census has resulted the following Sample figures :

	No. of Household by Sex of the Head of HH			No. of Population	
	Male	Female	Total	Male	Female
Urban	670	96	766	1,994	1,926
Rural	3,405	622	4,027	9,547	9,577

Inflation Factor for Household (IFHH) is different from population. And it was determined that IFHH is same with Inflation Factor for Head of Household. So, by using the above figures, we found that the IFHH for :

$$\underline{\text{Urban}} : 105,019/766 = 137,10$$

But, since we use only whole numbers (without fraction) then there will be two figures, i.e. 137 and 138. The same method was used for Rural which gives two inflation factor, i.e. 146 and 147.

The computation of population inflation factor (IPF) is rather different. IPF was calculated by dividing the number of population with the number of sample after subtracting total number of the head of household. For example, the IPF (other than head of household) for Male population in Urban was calculated as follows :

$$(277,884-137.10*670)/(1994-670) = 140.5$$

Since we only use whole numbers, then this result become two whole numbers, i.e. 140 and 141. The similar method was used to calculate IFP for Female population in Urban Area, which resulted the following number :

$$(262,156-137.10*96)/(1926-96)=136.06, \text{ or IFP } 136 \text{ and } 137$$
